# Triune Falsify-Me Abstract 29

## 1. **29. Monopole Problem Without Inflationary Dilution**

Standard treatments invoke inflation to dilute hypothetical magnetic monopoles. This abstract proposes a different route: monopoles never substantially form because the EM field emerges in a constrained, coherent topology supplied by the underlying triune and quantum-hydrogen structure. The claim is that chirality, polarity, and EM coherence were fixed at the first “electric bounce,” forbidding isolated magnetic charge configurations. Falsification: either a credible monopole detection or a theoretical proof that the proposed coherence constraints cannot survive realistic high-energy conditions.
