# Triune Falsify-Me Abstract 31

## 1. **31. Hazard Lattice: 64/128/448 Myr Windows in a Triune Cosmos**

We formalize a “hazard lattice” of planetary-scale events, characterized by repeating 64, 128, and 448 million-year intervals that align with major biospheric transitions and extinctions. In the triune view, these windows reflect the interplay of galactic dynamics, gravitational curvature, and EM structuring tied to deeper cosmic cycles. The claim is that this lattice is not numerology but a projection of large-scale triune phase structure onto planetary history. Falsification: improved astrochronology and extinction dating erase the apparent regularity or point to an unrelated mechanism.
